01 What is RestaurantOS?

RestaurantOS is a digital management system built specifically for restaurants. It replaces paper order books, manual billing, and spreadsheet-based sales tracking with a simple, modern platform that your entire team can use — from the kitchen to the front desk.

The system has two sides: an internal panel for your staff and owner, and a public-facing website where your customers can browse your menu and place orders directly — from home, from their office, or anywhere they have a phone.

A**No more paper orders**

Everything is recorded digitally, nothing gets lost.

B**Real-time kitchen updates**

The kitchen sees orders the moment they are placed.

C**Instant billing**

Generate a bill in seconds, no manual calculations.

D**End-of-day sales report**

Know exactly how much your restaurant earned today.

E**Online ordering**

Customers order from their phone — you receive it instantly.

02 Who is it for?

RestaurantOS is designed for small and medium-sized restaurants that want to run more efficiently without investing in complicated, expensive systems. It works especially well for:

- | | |
|-----------------------------|----------------------------------|
| ✓ Local restaurants | ✓ Fast food spots |
| ✓ Cafes and canteens | ✓ Family-run restaurants |
| ✓ Restaurants with delivery | ✓ Restaurants with table service |

You do not need to be a large restaurant chain to benefit from RestaurantOS. Even if you are running the restaurant alone, or with just two or three people, the system adapts to how your team is organised.

Built for Cameroon and Africa. RestaurantOS is designed with local restaurant realities in mind — affordable, simple to use, and accessible on any device including a basic smartphone. No expensive hardware required.

03 The two sides of the system

RestaurantOS has two separate interfaces that work together:

Internal Staff Panel

This is where your team works. Only your staff and owner can access it, with a secure login. Each person sees only what is relevant to their role.

Customer Website

The two sides are connected in real time. When a customer places an order online, it appears immediately in the staff panel — your waiter or cashier is notified, and the chef can start preparing right away.

04 Core Module — Menu Management

The menu is the heart of your restaurant. RestaurantOS gives you complete control over what you offer, at what price, and what is available on any given day — all manageable in seconds from your phone or computer.

What the admin can do

**Organise by category**

Starters, Main dishes, Drinks, Desserts — your structure, your way.

**Add dishes with photos**

Each dish has a name, description, price, and an optional photo.

**Toggle availability instantly**

Mark a dish as unavailable for today with one click — customers won't see it.

**Update prices anytime**

Change a price in seconds — it updates everywhere immediately.

**Set display order**

Control the order in which categories and dishes appear to customers.

What the customer sees

Customers visiting your restaurant's website see a clean, organised menu — grouped by category, with photos, descriptions, and prices clearly displayed. Dishes that are not available today are either hidden or shown as sold out. Customers can add items to their cart directly from the menu page.

Daily menu tip: Many restaurants update their menu every morning. With RestaurantOS, your waiter or admin can quickly mark which dishes are available today — this takes less than one minute.

05 Core Module — Order Management

Order management is where RestaurantOS saves the most time. Every order — whether taken by a waiter at the table, placed at the counter, or ordered online by a customer — goes through a single, clear flow that your whole team can follow in real time.

How an order moves through your restaurant

- | | | |
|---|----------------------------|--|
| 1 | Order is placed | By a waiter at the table, or by a customer online. |
| 2 | Kitchen is notified | The chef sees the order immediately on their screen. |
| 3 | Order is prepared | Chef marks items as ready one by one. |
| 4 | Order is ready | The waiter is alerted that the order is ready to serve. |
| 5 | Bill is generated | Cashier generates the receipt and collects payment. |
| 6 | Order is closed | Marked as completed and added to the daily sales record. |

Order types supported

Table order	Waiter selects the table number and takes the order item by item.
Takeaway	Customer comes in person — order is placed and collected at the counter.
Online order	Customer orders from home via the restaurant's website.

06 Core Module — Daily Sales & Cash

At the end of every day, you need to know one thing: how did your restaurant do today? RestaurantOS gives you a clear, accurate answer — automatically, without any manual counting.

Daily revenue total

Total amount collected for the day, in real time.

Orders summary

Number of orders completed, pending, and cancelled.

Best-selling dishes

See which dishes sold the most today.

Payment method breakdown

How much was paid in cash vs mobile money.

Shift closing

Close the day and lock the sales record for that date.

Sales history

View records from any previous day, week, or month.

The cashier has access to their own shift summary — how much they collected during their shift. The owner sees the full picture across all shifts and all days.

No more end-of-day confusion. With RestaurantOS, every payment is recorded when it happens. When you close the day, you already know the total — there is nothing to add up manually.

07 Your Team & Their Roles

Every restaurant is different. Some have dedicated waiters, cashiers, and chefs. Others are run by one or two people who do everything. RestaurantOS handles both situations through a flexible role system.

The roles available

A

Admin / Owner

Has full access to every part of the system — menu, orders, sales, staff management, and reports. The admin is the only one who can create other user accounts and assign roles.

W

Waiter

Can view the today's menu, create new orders for tables or takeaway customers, add items to an order, send the order to the kitchen, and follow the status of each order.

C

Cashier

Handles the financial side — generates bills, records payments, marks orders as paid, and can view their own shift sales total.

C

Chef

Has access only to the kitchen queue — sees incoming orders, marks individual items as prepared, and marks full orders as ready. No access to billing or sales data.

How roles are assigned

The admin creates a worker account and selects which roles that person will have. A single person can have one role or multiple roles at the same time. When they log in, they only see the features for their assigned roles.

Example	Roles assigned	What they see
Solo owner	Admin + Waiter + Cashier + Chef	Sees and manages everything
Front-of-house employee	Waiter + Cashier	Handles orders and payments
Dedicated cook	Chef only	Sees the kitchen queue only

08 Customer Online Ordering

RestaurantOS gives your restaurant its own ordering website. Your customers can visit it from their phone or computer, browse what is available today, and place an order — without calling, without coming in person, and without downloading any application.

The customer journey

1	Customer visits your restaurant's website They see your restaurant name, logo, and the menu for today.
2	They browse the menu Dishes are grouped by category. Each dish shows a photo, name, and price.
3	They build their order They add items to their cart, adjust quantities, and add any special notes.
4	They fill in their details Name, phone number, and whether they want delivery or will pick up in person.
5	Order is confirmed They receive an order number and can follow the status of their order.
6	Your team receives it instantly The order appears in the staff panel immediately — ready to be prepared.

No account or registration is required from the customer. They simply enter their name and phone number. This keeps the process fast and removes any barrier to ordering.

Grow your revenue without growing your team. Online ordering allows you to receive orders from customers who cannot come in — at any time of day. Your restaurant is open to orders even when you are busy serving other customers.

09 Add-on — Stock & Inventory Management

OPTIONAL ADD-ON

Stock and inventory management helps you track what ingredients and supplies you have in your restaurant. This module can be added to your RestaurantOS package for restaurants that want better control over their purchasing and stock levels.

Track ingredients

Record quantities of each ingredient you have in stock.

Low-stock alerts

Get notified when an ingredient is running low.

Update stock after orders

Optionally link dishes to ingredients for automatic deduction.

Supplier records

Keep a list of your suppliers and what you buy from each.

Purchase history

Track every time you restock — what you bought and how much you spent.

This module is particularly useful for restaurants that experience frequent stock-outs or want to reduce waste by tracking what they actually use versus what they buy.

10 Add-on — Table Reservations

OPTIONAL ADD-ON

The table reservation module allows customers to book a table in advance — directly from your restaurant's website. Your staff can see all upcoming bookings and manage the table layout from the admin panel.

B Online booking form
Customers choose a date, time, and number of guests.

C Booking confirmation
Customer receives a confirmation with their booking reference.

V Admin booking overview
See all reservations for today and upcoming days at a glance.

T Table map
A visual layout of your tables — see which are reserved or free.

M Manage bookings
Confirm, modify, or cancel bookings from the admin panel.

N Walk-in vs reserved
Distinguish between reserved tables and walk-in customers.

This module is ideal for restaurants that receive regular group bookings or want to give their customers the convenience of securing a table before they arrive.

11 Summary & Next Steps

RestaurantOS is designed to make your restaurant run better — with less confusion, fewer errors, and more visibility into how your business is performing every day.

What is included in the base package

Module	What it gives you
Menu Management	Full control over your daily menu, prices, and availability.
Order Management	Complete order flow from placement to delivery, for all order types.
Daily Sales & Cash	Real-time revenue tracking and end-of-day reporting.
Customer Website	Your restaurant's own online ordering page for customers.
Team Role Management	Flexible roles system for any team size.

Optional add-ons available

Add-on	What it gives you
Stock & Inventory	Track ingredients, get low-stock alerts, manage suppliers.
Table Reservations	Online booking, table map, and reservation management.

Getting started

RestaurantOS is customised for each restaurant. Your logo, colors, menu, and configuration are set up before you start using the system. The process is simple:

Step 1. We discuss your restaurant's needs and which modules are right for you.

Step 2. The system is set up and configured with your restaurant's information.

Step 3. Your team is shown how to use the system — it takes less than an hour.

Step 4. You go live and start using RestaurantOS in your restaurant.

RestaurantOS is built to grow with your restaurant. Start with the core modules and add more features when you are ready. You are never locked into more than you need.
